

## Anti-mole net

Anti-mole net is being used as a protection against unwanted activities of moles on cultivated grass plots, lawns, football playgrounds, golf areas as well as gardens around newly built houses.

For all owners of gardens and grass areas the anti-mole net is a good investment as they are aware that a single mole can destroy huge values and work of many people. Anti-mole net not only protects the lawns against mole activities but also strengthens the layer of the lawn and makes it more resistant against physical damages both during transportation (delivered in rolls) or on the spot. Most of the lawns delivered to the customers in rolls are already grown together with net or the net is applied on the ground before putting it down on the spot.

AICA quality nets are produced of new, tested materials and are strong enough to prevent the lawns upon any conditions.

Parametres of the net:

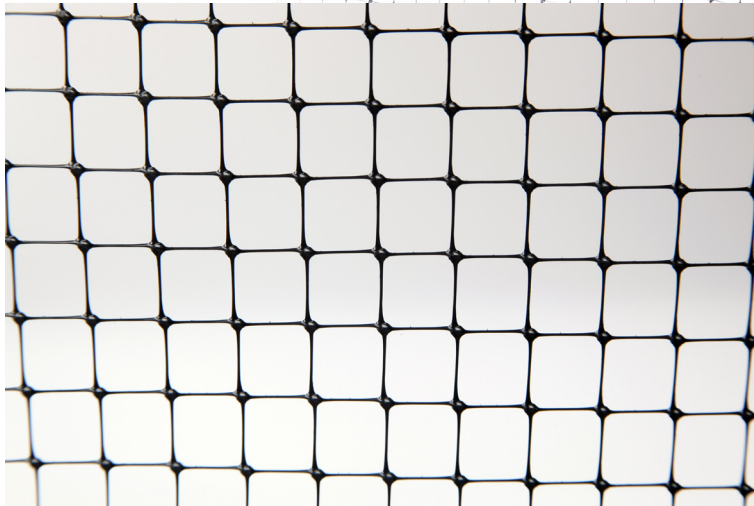

Mesh size: 16 x 16 mm

Weight of the net: 60g/m<sup>2</sup>

Width of the roll: 1 or 2m

Length: 200m / roll

Colour: black

### Advantages of the AICA branded anti-mole nets:

excellent quality of both material and manufacturing

long term reliability against penetration

attractive price

prompt delivery time
